#### INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

International application No.

PCT/US2004/002622

#### Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Reference is made to the following document:

D1: US-A-5 861 663 (SWAIN MILES FRANK ET AL) 19 January 1999 (1999-01-19)

The document D1 is regarded as being the closest prior art to the subject-matter of claim 1 and 9, and discloses:

An electrical connector for connecting between an electronic component and a circuit board via a plurality of solder balls soldering onto the circuit board, comprising an insulative housing forming a mounting surface adjacent to the circuit board and a receiving surface for supporting the electronic component, the insulative housing defining a plurality of channels extending through the mounting surface and the receiving surface; and a plurality of conductive plated surfaces respectively received in the corresponding channels, the channels having a mounting portion defining a pyramidal space to locate the solder ball.

The subject-matter of claims 1 and 9 therefore differs from this known connector in that: Instead of having a plated surface they have stamped terminals. This difference provides an improved terminal for locating and connecting the solder ball.

In the prior art the channels in the housing have a pyramidal space in the connecting end and are plated, providing a locating portion for the solder ball, although quite close the processes associated with the two methods are different. The terminal of claim 1 and the connector using such terminals of claim 9 are not obviously deduced from D1 and therefor the subject-matter of claims 1 and 9 is new and involves an inventive step. (Art. 33(2) and (3) PCT)

- 2. Claims 2-8 and 10-15 are further modifications of the subject-matter of claims 1 and 9 and therefor fulfill the requirements of Art. 33(2) and (3) PCT.
- 3. The application relates to electrical terminal and connector which has obviously an industrial applicability (Art. 33(4) PCT).

5

### JC20 Rec'd PCT/PTO 07 JUN 2005

#### **CLAIMS:**

What is claimed is:

1. A stamped and formed conductive terminal capable of being received within a terminal channel defined in an insulative housing and between an electronic component and a circuit board, having a contact portion electrically connecting with the electronic component and a mounting portion electrically connecting with the circuit board via a solder ball, comprising:

a first wall, a second wall connecting with the first wall in a certain angle and a third wall connecting with the second wall in a certain angle and opposite to the first wall, and the mounting portion defining a pyramidal space extending out of the insulative housing for receiving the solder ball.

- 2. The conductive terminal of claim 1 in which the mounting portion defines the pyramidal space by using a side wall connecting with an end of the first wall which circles around a fictitious central line as an axis.
- 3. The conductive terminal of claim 1 in which the mounting portion comprises a first side arm connecting with an end of the first wall and a second side arm connecting with an end of the third wall, the first side arm and the second side arm separately extend out of the insulative housing and define the pyramidal space.
- 4. The conductive terminal of claim 3 in which the mounting portion of the conductive terminal comprises a horizontal portion connecting with the second wall, the horizontal portion is between the first side arm and the second side arm, and has a certain degrees therebetween.
- 5. The conductive terminal of claim 1 in which the contact portion comprises a first spring arm formed on the first wall and a second spring arm corresponding to the first spring arm and formed on the second wall, the first spring arm and the second spring arm are adjacent to form a spring receiving structure.
- 6. The conductive terminal of claim 1 in which the pyramidal space is open at a top portion.

5

10

5

- 7. The conductive terminal of claim 1 in which a horizontal portion extends from one of the walls, the horizontal portion being located between the first and third walls.
- 8. The conductive terminal of claim 3 in which at least one of the side arms includes a recess.
- 9. An electrical connector for connecting between an electronic component and a circuit board via a plurality of solder balls soldering onto the circuit bard, having an insulative housing forming a mounting surface adjacent to the circuit board and a receiving surface for supporting the electronic component, the insulative housing defining a plurality of terminal channels extending through the mounting surface and the receiving surface, a plurality of stamped and formed conductive terminals respectively received in the corresponding terminal channels, comprising:

the conductive terminal having a first wall, a second wall connecting with the first wall in a certain angle and a third wall connecting with the second wall in a certain angle and opposite to the first wall, the conductive terminal forming a contact portion electrically connecting with the electronic component and a mounting portion electrically connecting with the circuit board via the solder ball, the mounting portion defining a pyramidal space extending out of the mounting surface of the insulative housing for receiving the solder ball.

- 10. The electrical connector of claim 9 in which the mounting portion of the conductive terminal defines the pyramidal space by using a side wall connecting with an end of the first wall which circles around a fictitious central line as an axis.
- 11. The electrical connector of claim 9 in which the mounting portion of the conductive terminal comprises a first side arm connecting with the first wall and adjacent to one end of the mounting surface and a second side arm connecting with the third wall and adjacent to one end of the mounting surface, and the first side arm and the second side arm aslant extend out of the mounting surface and are apart from each other to define a coneshaped pyramidal space.
